I have an additional comment on my proposed schema:

I've added an ID-attribute to all lineElements for the unique identification (which is necessary e.g. for visualisation) of a lineElement within one track. So we can identify a lineElement globally using the combination of lineId, trackId and ID.

Alternatively we could also define that the ID of any lineElement has to be globally unique.

I think that the former idea of identifying lineElements by lineId-trackId-pos has the disadvantage, that there can't be 2 or more lineElements on exactly the same position (or is the occurrence of this situation not feasible?). That's why I added the ID-attribute.

Best regards
Matthias Hengartner
