Dear railML infrastructure forum,

This posting contains the discussion to an extension towards the
ocsElements

Locks are simple physical lineside elements that can only have two states: locked or unlocked.
Locks reference to which objects they lock. Their relationship will later be defined in the
interlocking scheme.

The element <ocsElements> is extended with the new element <locks> with sub element <lock>
with attributes @objectRef and @type [datatype: enumeration] with 5 Norwegian presets, the
value "ERTMS" and "other:".
