Subject: @code as element name

Dear all,

in the current IL schema the basic type EntityIL is derived from common type tElementWithIDandCode because

tElementWithIDandName includes not only @name but also language variants of it. This was not desired for IL. However,

with tElementWithIDandCode the attribute @code stands for the element name. This might cause some confusion especially

if @code would be required in TvdSection for identifying the set code of a track circuit.

Currently it would like this:

```
<rail3:ownsTvdSection isBerthingTrack="true" code="Arnau A02" id="A02T"
```

```
partialRouteReleaseTimer="PT1S"
```

```
isReliable="true" residualRouteCancellationTimer="PT90S">
```

```
<rail3:hasDemarcatingBufferstop ref="bus02"/> <!-- reference to bufferStop in IS -->
```

```
<rail3:hasDemarcatingTraindetector ref="tde02"/> <!-- reference to trainDetectionElement in IS
```

```
-->
```

```
<rail3:relatedToTrack ref="trc02"/> <!-- reference to track in IS -->
```

```
</rail3:ownsTvdSection>
```

Regards,

Jörg von Lingen - Interlocking scheme coordinator
