Hi Stefan,

as Vasco said, we will need to know a little more about what you are trying to achieve. Depending on the use case I think a possible way of modelling this could be to break up your OCP "ARR-StopArea-Gn" into several ones and group those using parentOcpRef (microscopic view of the infrastructure), like Dirk suggested. Knowing the use case would help us to determine if this would be a feasable solution or if other constraints apply.

Best regards, Milan
