Dear Torben,

that is an interesting topic you are bringing up. I see the benefit / use case, but I have some fundamental questions:

1) What is the official reference code for a restriction? Do you have any examples?
2) The additional running time has further input factors beside the direction. How about different train types etc.? How many different additional running times exist for one single working area?
3) What is meant with "ID of the working zone"? Can this information be covered with a designator?

Like Torben, I am curious to hear further opinions and feedback from the community...

Best regards
Christian
