The proposal is quite a large redesign in a late stage. But the norwegian sector can live with the solution after we have checked it. What imideately comes to mind is that in #395:

- the sub element <localArea> is missing (as a redesign of in option 1 proposed @type="local")
- the removed controller reference from the generic area needs to be added somehow in the new sub elements (like for instance <trackVacancyDetectionArea>)
- a misunderstanding that working zones (#395) are the same as working areas and the attributes for working zones have been placed under workingArea. #395 should be as proposed but with a new sub elements <workingZone>

We need some more time to check for the rest... But in principle the solution suggestion as posted here and in #395 is acceptable.
