Dear Christian,

It seems to me that there are no attributes on whether a speed change is signalled and pre-signalled? Two boolean attributes would be needed. (Signalled: Is there any kind of sign at the place where the speed change applies? Pre-signalled: Is there any kind of sign at a proper pre-signalling distance before the place where the speed change applies?)

From such attributes, for instance, it depends whether a speed change is printed inversely in German drivers timetables.

Best regards,
Dirk.
