Hello, Mr. Linder.

I have simple questions for your new version of infrastructure schemas.

1. In v0.93, we have had elements of "crossover" and "junction", but in the newest version, no elements for 2 infrastructures. Do you have some reason?
2. There are 2 different type elements for 1 infrastructure e.g. gauge element and gaugeChange element. How should we use properly these elements?
3. "CrossSection", "border", "switche", "tunnel" and "signal" elements have the attributes for their names. But other elements e.g. bridge have no attributes for names. We hope all elements for 1 unique infrastructure have an attribute for its name. (Especially bridge, levelCrossing) Could you make new attributes for names?
4. What is the new element "mileageChange" ?

Best regards from Tokyo
